

65. Family PYRGOTIDAE

By Brian R. Pitkin

There are about 330 species and 50 genera of Pyrgotidae worldwide with over one-third of these from the Afrotropical Region. Three subfamilies [Lochmostyliinae, Pyrgotinae, and Toxurinae (= Paratoxurinae)] are currently recognized, but thorough morphological study of the genera is needed before interrelationships of these 3 can be understood. There are 73 species in 17

genera recorded from the Australasian/Oceanian Regions.

The biology of only a few species is known. The larvae are internal parasitoids of Coleoptera and Hymenoptera. The adults are mainly nocturnal and are most easily caught using light traps, but adults of *Prodalmannia* visit flowers by day.
