

CATALOG OF ENTOMOLOGICAL TYPES IN THE BERNICE**P. BISHOP MUSEUM****Diptera: Culicidae¹**By Joaquin A. Tenorio²

Abstract: Holotypes of 27 species of mosquitoes deposited in the Bishop Museum entomological type collection are reported. A summary of the mosquito holdings of Bishop Museum is also presented.

This catalog lists the holotypes of 27 species of mosquitoes in 2 genera and 4 subgenera presently lodged in the Bishop Museum Entomological Type Collection. All but 2 of these holotypes (1 from Malaysia and 1 from the Philippine Islands) are from New Guinea and the Bismarck Archipelago. The genera and subgenera included are as follows: *Aedes* (*Huaedes*) with 1 species; *Aedes* (*Neomacleaya*) with 2; *Aedes* (*Verrallina*) with 4; and *Culex* (*Lophoceraomyia*) with 20 species. Other genera and subgenera of Bishop Museum material are presently being studied by various specialists and, undoubtedly, more holotypes will be deposited in the museum collection. When these studies have finally been completed and results published, a supplement to this catalog will follow.

The holotypes included herein are, in most cases, accompanied by an allotype and slides of genitalia, legs, antennae, and associated larval and pupal skins. In some cases, an allotype was not designated by the author, and in several cases the allotypes have been lost. The pinned holotype of *Culex minjensis* Sirivanakarn is lost; however, slide mounts of genitalia and antennae of the holotype are present in the collection. This kind of information is included in the "Remarks" category under each species. In the "Biotope" category, code numbers of the holotypes are entered if available. These numbers refer to field cards which contain ecological information on the holotypes. These cards are filed, and easily retrievable, in the Department of Entomology, Bishop Museum. The format used in listing other data for each type is further explained in Radovsky et al. (1976).

The Culicidae collection in the Bishop Museum contains approximately 197,000 specimens which include 55,000 pinned adults, 41,000 slide mounts, and about 101,000 specimens, mostly immatures, preserved in alcohol.

The majority of pinned specimens have been sorted to genera and subgenera, and many identified to species. Approximately 1/2 of this material was collected in New Guinea (28,830). The remainder is from the following localities: Ambon I (10,802), Australia (831), Bismarck Archipelago (1070), Borneo (176), Celebes (239), Japan (41), Java (791), Malaysia (147), Micronesia (1456), other Pacific Islands including Hawaiian Is (3895), Philippines (1683), Ryukyu Is (50), Solomon Is (811), Sumatra (15), Taiwan (308), Thailand (62), Vietnam (105), and miscellaneous localities (1785).

Most of the slide mounts are of material from New Guinea (30,520), Bismarck Archipelago (2236), Indonesia (3156), other Pacific Islands (3224), and Solomon Is (1635). Other areas which are also represented, but with fewer number of specimens, are

¹Partial results of the Mosquitoes of New Guinea project supported by grants AI07917-07 (NIH) and DADA 17-73-C-3143 (USAMDC).

²Bernice P. Bishop Museum, P. O. Box 6037, Honolulu, Hawaii 96818, U.S.A.

Australia, Borneo, Japan, Malaysia, Micronesia, Philippines, Ryukyu Is, Taiwan, Vietnam and Laos. Of about 41,000 mounts, approximately 5000 are not yet sorted to genera.

The alcohol material contains the greatest number of specimens with approximately 101,000. All except about 500 specimens are from New Guinea, and part of these are duplicates of specimens which have been mounted on slides. The remainder of this material is from Ambon I, Bismarck Archipelago, Malaysia, other Pacific Islands, Philippines, Solomon Is, Taiwan, and miscellaneous localities.

Of the total number of mosquitoes now in the Bishop Museum, about 161,000 are from New Guinea and adjacent islands. Much of this material was collected by Bishop Museum staff and collaborators in conjunction with the Mosquitoes of New Guinea Project funded by NIH and U.S. Army grants.
